EXECUTIVE **SUMMARY**

The Broadband Quality of Experience Survey 2024 (BQoES 2024) marked the fourth edition of the survey commissioned by the Malaysian Communications and Multimedia Commission (MCMC). The primary objective of this survey is to evaluate the level of consumer satisfaction among consumers of broadband services in Malaysia. The insights from this survey enable related stakeholders to enhance the service quality and effectively address consumer concerns.

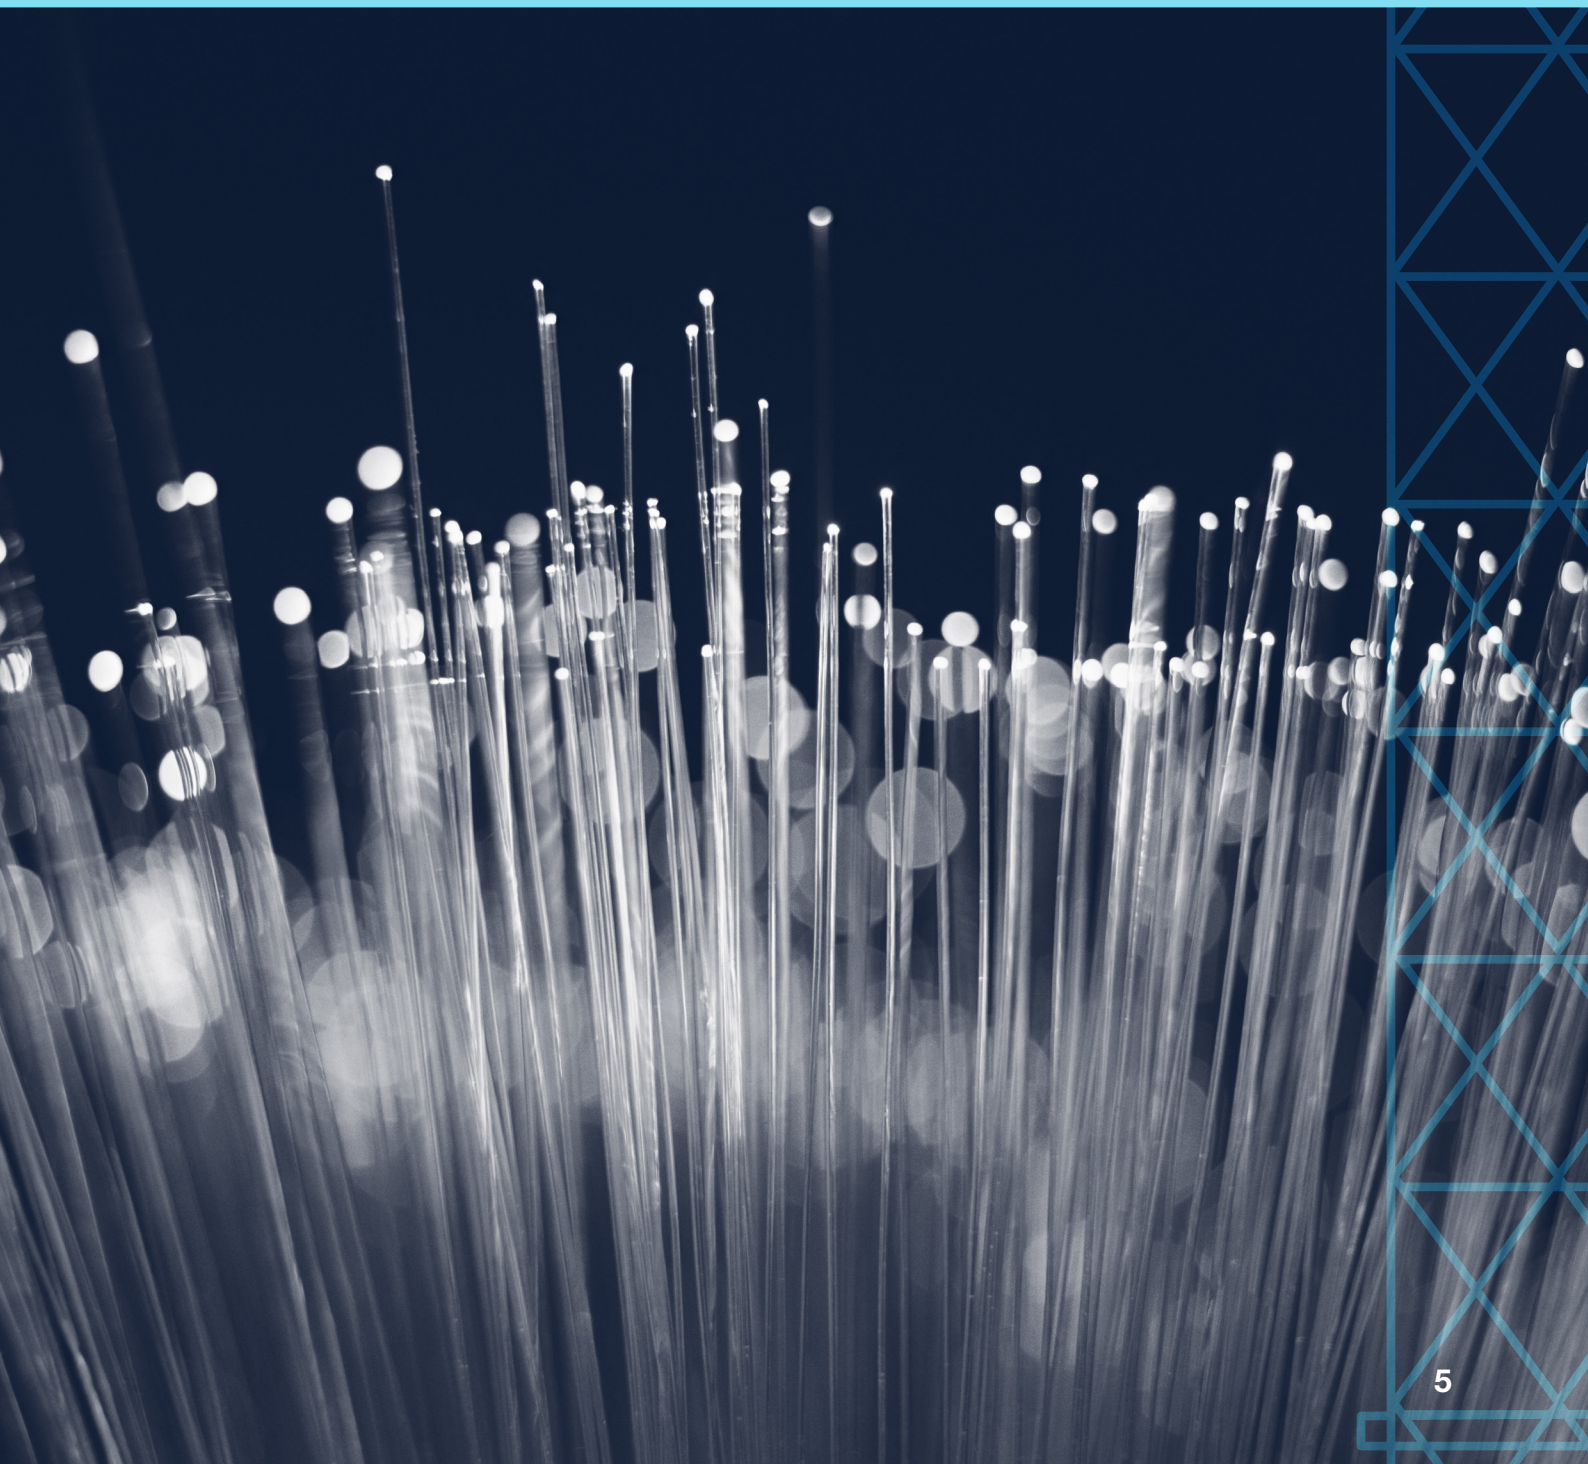

The survey placed its focus on evaluating broadband quality of experience through analysis across five distinct scopes: video streaming, which encompasses the seamless delivery and playback of multimedia content; web browsing, assessing the responsiveness and speed of accessing online websites and services; online gaming, evaluating the performance for immersive gaming experiences; online voice calls, examining the clarity and reliability of voice communication over the Internet; and online video calls, scrutinising the stability and visual quality of real-time video conversations conducted online.

BQoES 2024 covered consumers of both fixed and mobile broadband services. The survey maintained a confidence level of 95% and a precision of ±5% for each service provider, reaching a sample size of 4,608 respondents. For data collection, respondents were evaluated using both Computer-Assisted Telephone Interview (CATI) and MCMC's secure online survey questionnaire portal.

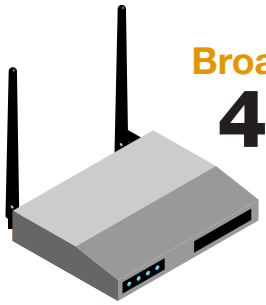

Overall findings indicate that both services had a positive growth in their Consumer Satisfaction Index (CSI) in comparison to the previous year's results. Web browsing continues to achieve the highest CSI for both fixed and mobile broadband services while online gaming remains with the lowest CSI score. However, both services witnessed highest increase on this scope and managed to raise customers satisfaction level from dissatisfied to adequately satisfied.

KEY HIGHLIGHTS

OVERALL CSI SCORE

Fixed Broadband
4.00

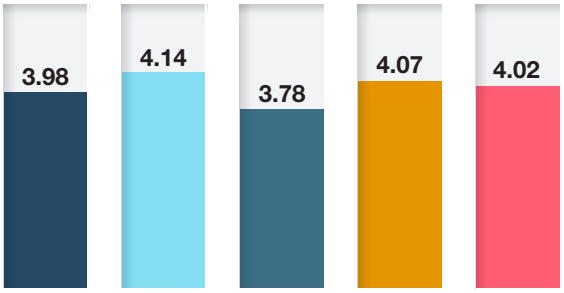

Mobile Broadband
3.93

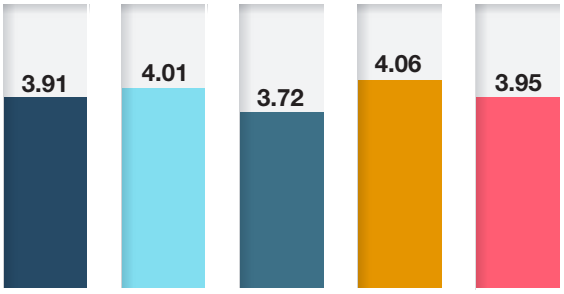

Fixed broadband consumers reported a high level of satisfaction with the service, whereas mobile broadband consumers indicated an adequate level of satisfaction.

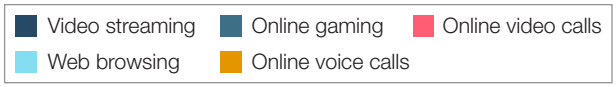

CSI BY SCOPE

Fixed Broadband

Mobile Broadband

For fixed broadband, web browsing received the highest satisfaction score while for mobile broadband, the highest-rated activity was online voice calls.

SERVICE QUALITY GAP (SQG) & KEY AREAS TO MONITOR

Fixed Broadband

Web browsing
SQG: **-0.32**

Online voice calls
SQG: **-0.18**

Online video calls
SQG: **-0.11**

Mobile Broadband

Online voice calls
SQG: **-0.34**

Web browsing
SQG: **-0.31**

Online video calls
SQG: **-0.19**

The highest gap between consumers' expectation and service providers' performance were observed in web browsing, online voice calls and online video calls.

These areas have been identified for monitoring to sustain performance and customers satisfaction.

CONSUMERS CONSUMPTION PATTERN

Fixed Broadband

Video Streaming
97.5% users streamed online, with YouTube being the most used platform at 48.5%

Online Gaming
52.3% users engaged in online gaming, with 62.0% using smartphones as their main device

Online Video Calls
98.4% users experienced online video calls with WhatsApp being the most popular app at (78.8%)

Web Browsing
56.7% users browsing via web browser with Google Chrome dominating at 78.0%

Online Voice Calls
96.8% users made online voice calls with WhatsApp as the top platform (96.0%)

Mobile Broadband

Video Streaming
83.5% users streamed online with YouTube leading at 38.3%

Online Gaming
48.6% users engaged in online gaming, with 89.7% using smartphones as their main device

Online Video Calls
88.7% users participated in online video calls, with WhatsApp being the most popular app (89.5%)

Web Browsing
55.8% users browsing via applications with Shopee dominating at 54.6%

Online Voice Calls
89.3% users made online voice calls with WhatsApp as the top platform (96.0%)

METHODOLOGY

SURVEY METHODOLOGY

The survey covered two types of consumers: Fixed Broadband (FBB) and Mobile Broadband (MBB) consumers. Three service providers (SPs) were included in the FBB service, while six SPs were included in the MBB service, as listed in Table 1 below.

SERVICE	SERVICE PROVIDER
Fixed Broadband	Maxis Communications Berhad (Maxis)
	TM Technology Services Sdn. Bhd. (TM-Tech)
	TT dotCom Sdn. Bhd. (TIME)
Mobile Broadband	CelcomDigi Berhad (Celcom and Digi)
	Maxis Broadband Sdn. Bhd. (Maxis)
	U Mobile Sdn. Bhd. (U Mobile)
	TM Technology Services Sdn. Bhd. (TM-Tech)
	YTL Communications Sdn. Bhd. (YTLC)

Table 1: List of Service Providers Covered in BQoES 2024

The sample population for this survey were selected by the following methods:

1. Mobile Station International Subscriber Directory Number (MSISDN) were generated randomly and submitted to SPs for verification (e.g. active, inactive, ported-out). Interviewers will then call the active numbers and collect the completed responses; and

2. Survey link and QR code were disseminated through MCMC website, social media, and SP's website. The public could access the survey link and QR code from a variety of devices, including smartphones, Internet-enabled feature phones, desktops, laptops and tablets.

The survey adopted a confidence level of 95% with a precision level of ±5% for both services, reaching a sample size of 1,152 respondents for FBB and 2,304 respondents for MBB.

SCOPE OF SURVEY

BQoES 2024 focused on five scopes within broadband services: video streaming, web browsing, online gaming, online voice calls and online video calls. The survey questions corresponding to each scope are listed in Table 2 below.

SCOPE	QUESTION
Video streaming	1. Name of video streaming service mostly used
	2. Level of importance
	3. Level of satisfaction
Web browsing	1. Name of website/app mostly visited
	2. Name of web browser mostly used
	3. Level of importance
	4. Level of satisfaction
Online gaming	1. Name of online game mostly played
	2. Name of device mostly used for online gaming
	3. Level of importance
	4. Level of satisfaction
Online voice calls	1. Name of application mostly used for online voice calls
	2. Level of importance
	3. Level of satisfaction
Online video calls	1. Name of application mostly used for online video calls
	2. Level of importance
	3. Level of satisfaction

Table 2: List of Scopes and Questions for BQoES 2024

These scopes were evaluated according to consumers' perceptions relating to their expectations and performance of each service provider, using a 5-point Likert scale.

Consumers' expectations were measured based on their level of importance towards broadband services, while service providers' performance is based on their level of satisfaction, as illustrated in Table 3 below.

RATING SCALE	EXPECTATION	PERFORMANCE
5	Extremely important	Extremely satisfied
4	Somewhat important	Somewhat satisfied
3	Neutral	Neutral
2	Somewhat not important	Somewhat dissatisfied
1	Extremely not important	Extremely dissatisfied

Table 3: 5-Point Likert Scale

In addition, the survey also addressed eight demographic profiles of consumers, including age, nationality, gender, employment status, highest level of education, ethnicity, average monthly income, and urban-rural distribution.

SURVEY FRAMEWORK

To align with the objectives of BQoES 2024, the framework was developed based on three analyses, as depicted in Figure 1 below.

SURVEY OBJECTIVES	ANALYSIS
To understand and measure consumer satisfaction level	Consumer Satisfaction Index (CSI)
To benchmark consumers' needs and expectations for FBB and MBB services	Service Quality Gap (SQG)
To identify areas of improvement of FBB and MBB services	Importance-Performance Analysis (IPA)

Figure 1: Framework of BQoES 2024

Consumer Satisfaction Index (CSI)

Over the past few decades, consumer satisfaction has been defined in various ways. Literature suggests that it can be described as the judgement, impression, response, or evaluation based on the products or services received by consumers.

For instance, Anderson et al. (1994)[1] suggested that consumer satisfaction could be defined in two different ways depending on the consumer experiences: specific experiences and cumulative experiences. During specific experiences, consumer satisfaction is defined as the post-choice evaluative judgement of a specific purchase occasion. Meanwhile, for cumulative experiences, consumer satisfaction is determined as a result of consumers' evaluation of their total purchase and consumption experience over time.

However, focusing on satisfaction solely is not sufficient, as understanding the requirements or expectations from consumers need to be considered as well. In today's highly competitive market, where all service providers have equal opportunities to provide services, it is essential for them to measure themselves on their ability to meet beyond customers' expectations. According to Gitomer, J. (1998)[2], he stated that satisfaction is the consumer's assessment of a product or service in terms of the extent to which that product or service has met his/her needs or expectations.

Therefore, in BQoES 2024, CSI was evaluated based on consumers' experiences with the performance of service providers and their expectations. Additionally, the market share of each service provider was incorporated as a final weighting factor to calculate the individual service provider's CSI score, as shown in Figure 2.

CONSUMERS EXPECTATION

Measured based on consumers' perception towards importance of services using 5-point Likert scale

SERVICE PROVIDER PERFORMANCE

Measured based on level of consumers' satisfaction using 5-point Likert scale

CSI Score

$$\sqrt{\frac{Expectation \times Performance + Performance}{2}}$$

Overall CSI Score *(Industry Average)*

$$\sum_{k=1}^{n} w_i \frac{\sqrt{I_k P_k + P_k}}{2}$$

Where
w = market share,
I = importance score,
p = performance satisfaction score
k = attribute,
n = number of service providers

Figure 2: Consumer Satisfaction Index Model for BQoES 2024

[1] Anderson, E. W., Fornell, C., & Lehmann, D. R. (1994). Customer satisfaction, market share, and profitability: Findings from Sweden. Journal of marketing, 58(3), 53-66.

[2] Gitomer, J. (1998). Customer satisfaction is worthless, customer loyalty is priceless: How to make customers love you, keep them coming back, and tell everyone they know. Austin, TX: Bard Press

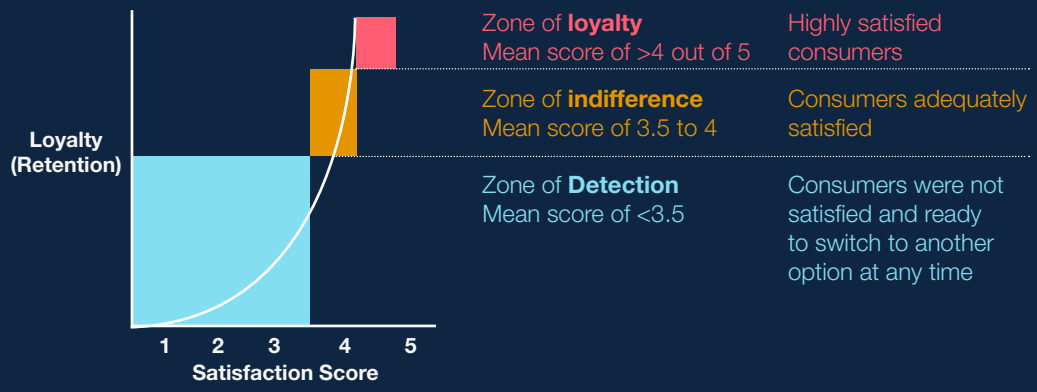

Figure 3: CSI Scores and Interpretation

Accordingly, the interpretation of the CSI score is based on relationship between loyalty and satisfaction as described in the Profit Chain from Heskett et al. (1997). Figure 3 illustrated the interpretation[3] of the CSI scores.

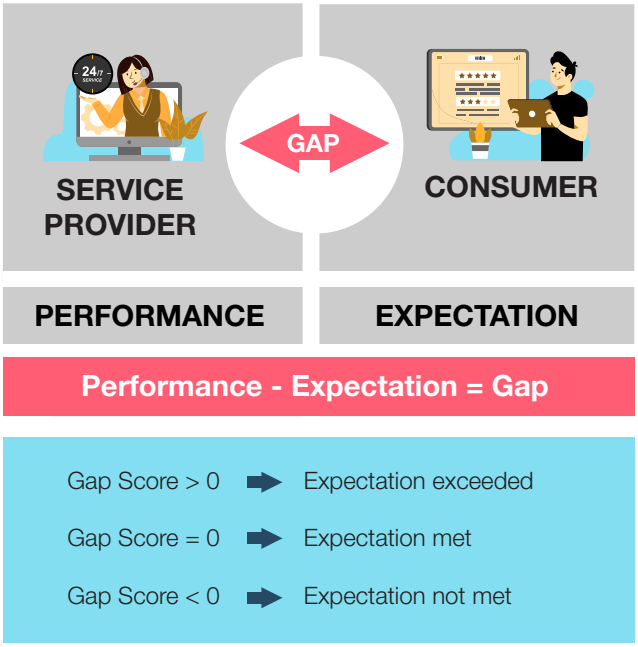

Figure 4: Service Quality Gap Model for BQoES 2024

Service Quality Gap Analysis

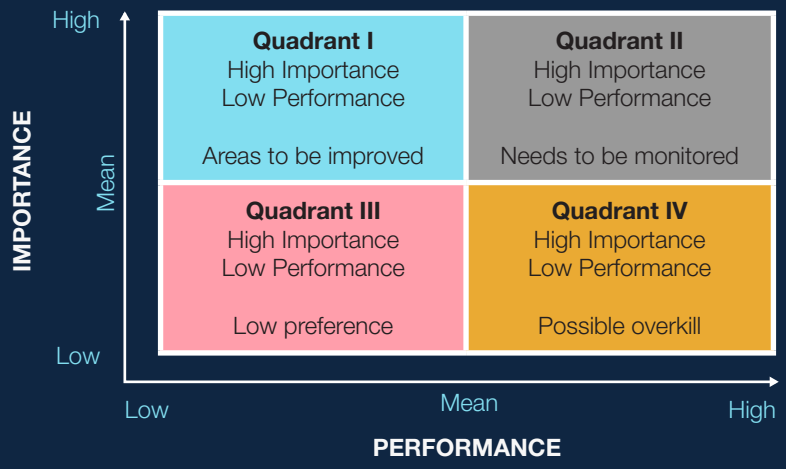

Service Quality Gap (SQG) analysis was conducted to explore whether the performance of the broadband service providers meets consumers' expectations. Adapted from Parasuraman et al. (1985), SQG analysis involves assessing the mean difference between the performance and expectation scores. Figure 4 illustrates the computation of the SQG analysis.

[3] Interpretation of the CSI score based on the relationship between loyalty and satisfaction as described in the Profit Chain from Heskett, J., W. E. Sasser Jr., and L. Schlesinger. The Service Profit Chain: How Leading Companies Link Profit and Growth to Loyalty, Satisfaction, and Value. New York: Free Press, 1997

Importance-Performance Analysis

Importance-Performance Analysis (IPA) was carried out to identify the high-performing scopes as the strength of the service providers as well as the low performing scopes that required intervention for improvement.

Developed by Martilla and James (1977), IPA identifies the relative importance (expectation) of the attributes associated with a service or product while at the same time indicating the degree of performance (satisfaction). The results are plotted graphically on a two-dimensional grid, in which the performance of the attribute is displayed on the horizontal axis while the importance level is displayed on the vertical axis. Figure 5 illustrated details of IPA.

Areas to be improved	Needs to be monitored	Low preference	Possible overkill
This quadrant suggests the need for direct improvement actions, as the attributes are highly important but show low satisfaction in their performance	This quadrants needs to be monitored to ensure satisfaction is maintained, as the attributes exhibit high levels of both satisfaction and importance	This quadrant comprises attributes that are relatively less important from consumers' perspective, with lower level of satisfaction. These attributes should be re-evaluated, and service providers may consider reallocating resources to enhance other performance attributes that consumers perceive as more significant	This quadrant has low importance among consumers, but service providers appear to place excessive emphasis on delivering beyond expectation

Figure 5: Importance-Performance Matrix and Its Interpretation

MAIN FINDINGS

This section consists of four main findings as follows:

1. Overall CSI score for FBB and MBB consumers.

2. FBB consumers:
   a. CSI score by scope;
   b. Service Quality Gap Analysis;
   c. Importance-Performance Analysis; and
   d. Consumers' consumption pattern by service.

3. MBB consumers:
   a. CSI score by criteria;
   b. Service Quality Gap Analysis;
   c. Importance-Performance Analysis; and
   d. Consumers' consumption pattern by service.

4. Demographic profile for FBB and MBB consumers.

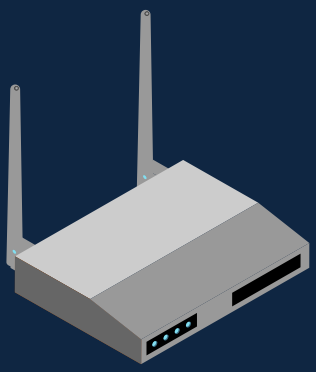

OVERALL CSI SCORE FOR FBB AND MBB CONSUMERS

The survey found that overall CSI score for FBB and MBB services were recorded at 4.00 and 3.93, respectively, as illustrated in Figure 6.

These scores suggest that FBB consumers showed a high level of satisfaction with the services provided by their service providers, indicating that overall quality and performance of FBB service generally meet the consumers expectations.

In comparison, MBB consumers expressed an adequately satisfied, indicating a generally positive perception of service quality and performance, albeit with slightly more room for improvement compared to FBB.

4.00

Fixed Broadband

3.93

Mobile Broadband

Figure 6: Overall CSI Score

FBB CONSUMERS

CSI Score by Scope

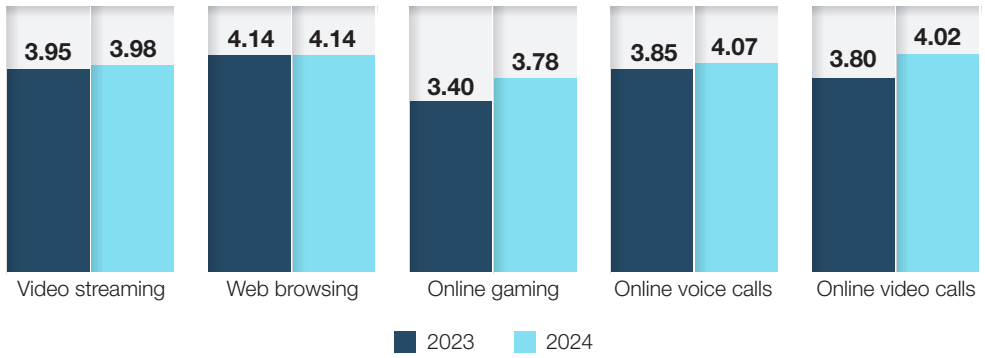

Figure 7: CSI Score by Scope for FBB

Notably, among FBB consumers, web browsing garnered the highest satisfaction score (CSI of 4.14), followed by online voice calls (4.07) and online video calls (4.04) making the latter two improve their year-on-year performance and reach the Zone of Loyalty (>4.00).

A detailed comparison revealed that online gaming experienced the most significant increase, with a rise of 0.38, reflecting a positive trend in user experience. This indicates that improvement in broadband connectivity will enhance the service providers' performance and contribute to the decent users' expectations and satisfaction. Figure 7 shows a more comprehensive understanding of CSI scores across all criteria.

Service Quality Gap Analysis

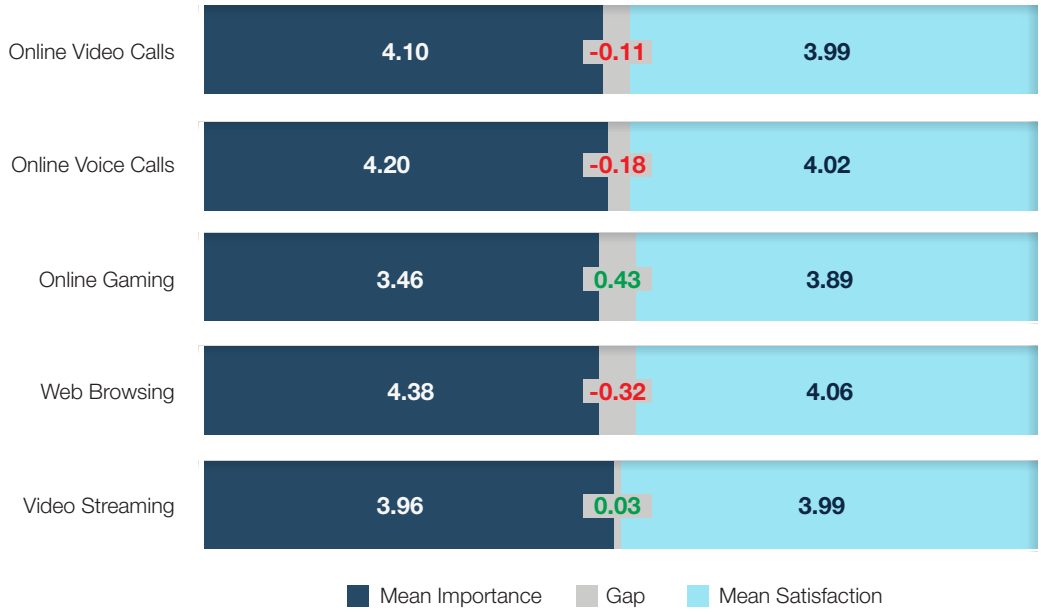

Figure 8: Service Quality Gap by scope for FBB

SQG Analysis was conducted to monitor consumers' expectations and satisfaction. Addressing these identified shortfalls is foundational for planning strategies to ensure customer experiences that align with their expectations, thereby increasing the likelihood of satisfaction.

Overall, the performance of FBB services shows a negative gap score of -0.03, demonstrates that consumers' expectations.

Nonetheless, further results discovered that online gaming shows a significant positive gap of 0.43 while video streaming demonstrated a modest positive gap of 0.03. These results highlight that FBB service is exceeding consumers expectation in both scopes.

On the other hand, the gap score for remaining three scopes were less than zero. Topping the list was web browsing (Gap: -0.32), followed by online voice calls (Gap: -0.18) and online video calls (Gap: -0.11).

Importance-Performance Analysis (IPA)

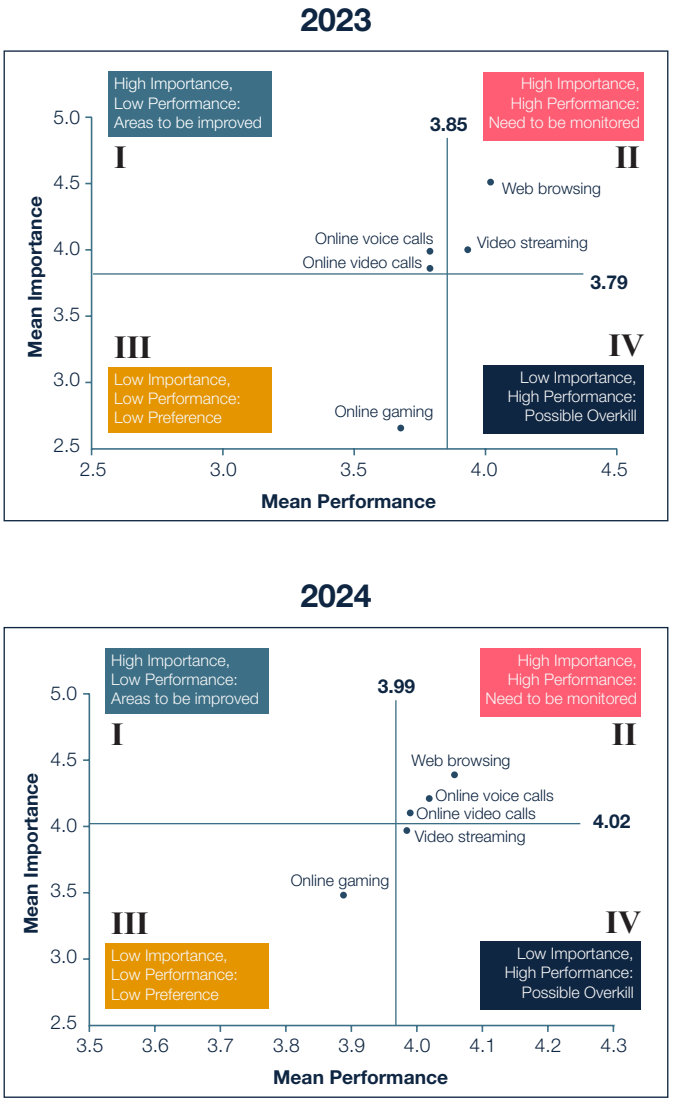

Figure 9: Importance-Performance Analysis for FBB

IPA was conducted to identify the attributes most in need of improvement and to ensure efficient allocation for services provided by service providers. The results of IPA were visualised in a four-quadrant matrix to categorise attributes: Quadrant I represents attributes needing improvement, Quadrant II includes attributes to be monitored, Quadrant III comprises attributes with low preference, and Quadrant IV indicates attributes with possible overkill.

Figure 9 illustrates the relative positions of attributes in matrix format, with importance values on the vertical axis and performance values on the horizontal axis.

Overall, BQoES 2024 results showed that mean importance and mean performance for FBB increased from 2023 and stood at 4.02 and 3.99 respectively. This implies that improvements in entertaining customers over the year have positively impacted customers satisfaction and expectations.

From the IPA analysis, online voice calls and online video calls successfully improved their performance to gain a position from Quadrant I in 2023 to Quadrant II in 2024. Web browsing maintains its performance above average in Quadrant II (High importance, High performance). Hence, these scopes need to be monitored accordingly to sustain performance and customers satisfaction.

Consumers Consumption Pattern by Scope

Video streaming

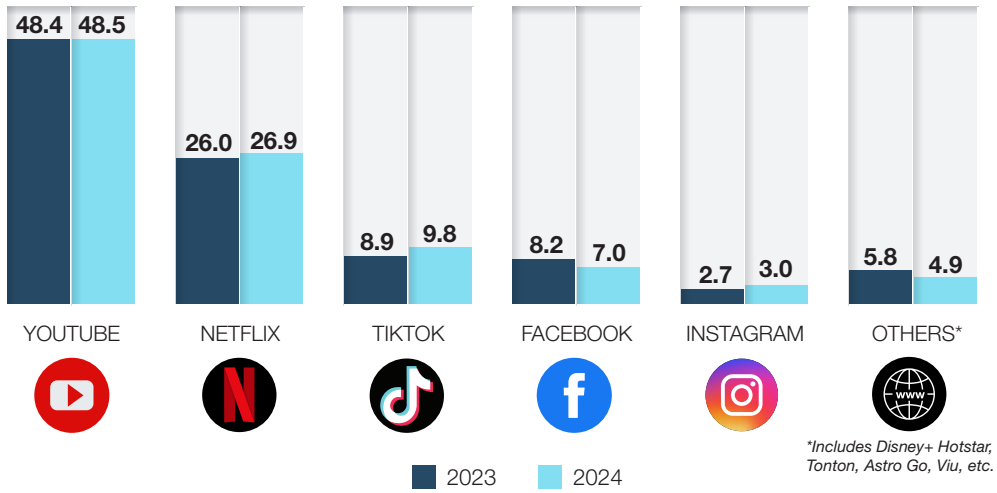

Figure 10: Video Streaming Experience by FBB Consumers (%)

The survey further discovered that 95.7% of FBB consumers watched videos online, with nearly half (48.5%) of them streaming through YouTube, followed by Netflix and TikTok. Figure 10 shows that the percentage of consumers who streamed videos via these platforms experienced a minimal increase from 2023 to 2024 while Facebook observed a decline during the same period.

Although a high percentage of consumers streamed videos online, a small portion of 3.2% stated their dissatisfaction with the service. The most frustrating experience, mentioned by 38.9% of users was video stalls and buffering (Figure 11).

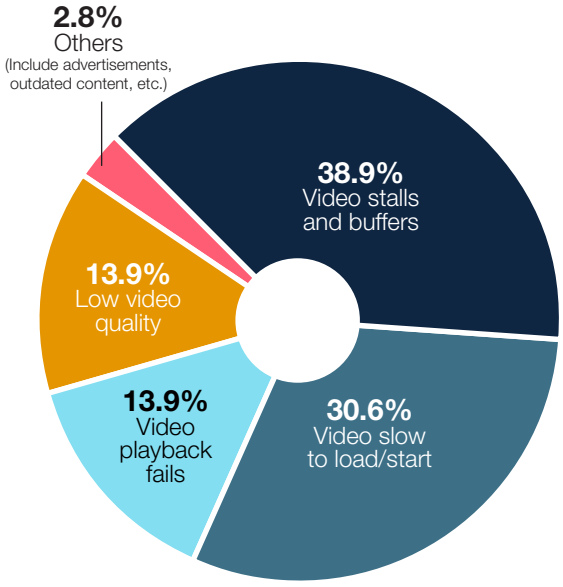

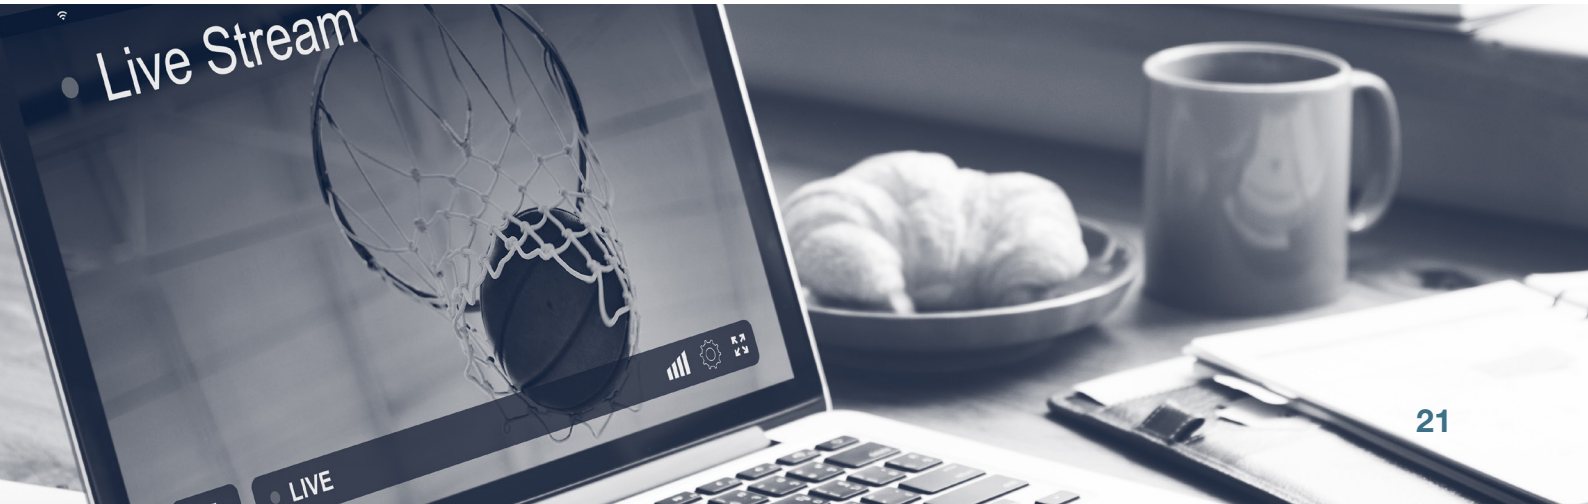

Figure 11: Main Reason for Video Streaming Dissatisfaction

Web browsing

BQoES 2024 revealed that 56.7% of FBB consumers preferred to use web browser while 43.3% favoured application for their web browsing activities. Among those who preferred to use web browser, 78.0% browsed through Google Chrome followed by 12.0% through Safari. On the other hand, Shopee was the most popular application among FBB consumers (49.2%) followed by Grab and Spotify with 12.9% and 8.8% respectively.

Further analysis shows that the percentage of dissatisfied consumers with web browsing experience has significantly declined from 6.0% to 0.9% year-on-year. The main reasons mentioned were disappointment with waiting for pages to load (29.2%) and slow download speed (20.8%).

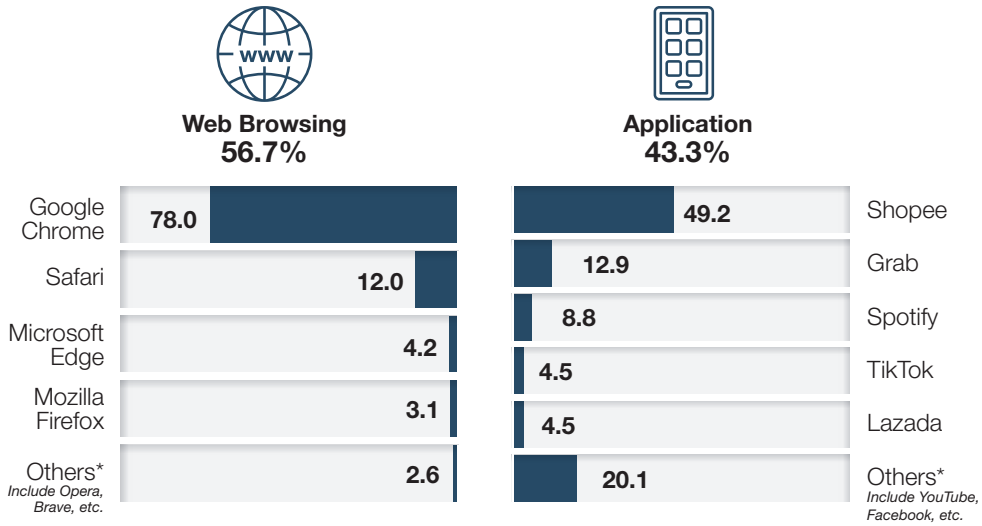

Figure 12: Web Browsing Experience by FBB Consumers (%)

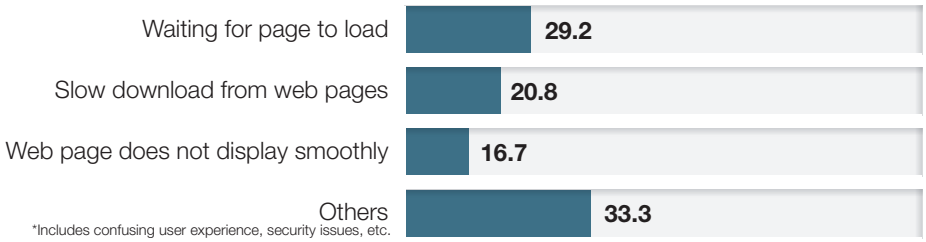

Figure 13: Main Reason for Web Browsing Dissatisfaction (%)

Online gaming

Online gaming has become an integral part of modern entertainment, offering a dynamic and interactive experience for players across the world. BQoES 2024 found that the percentage of online gamers has increased from 41.7% in 2023 to 52.3% in 2024. The most popular online games among FBB consumers were Mobile Legends: Bang Bang (25.4%), Candy Crush Saga (9.1%), Roblox (7.1%) and PlayerUnknown's Battlegrounds Mobile (7.0%). Among the least played online games by consumers were FIFA Ultimate Team, Clash of Clans, Monopoly Go!, Call of Duty and DOTA.

However, 3.5% (decline from 14.8% in 2023) of online gamers among FBB consumers expressed their dissatisfaction with the service, citing reasons such as animation stuttering (42.9%) and latency and lag (33.3%).

When asked about the devices they mainly used for playing online games, FBB consumers indicated that smartphones were the most prevalent (62.0%), followed by PC/laptop (20.7%), smart TVs (10.1%) and gaming consoles (7.1%).

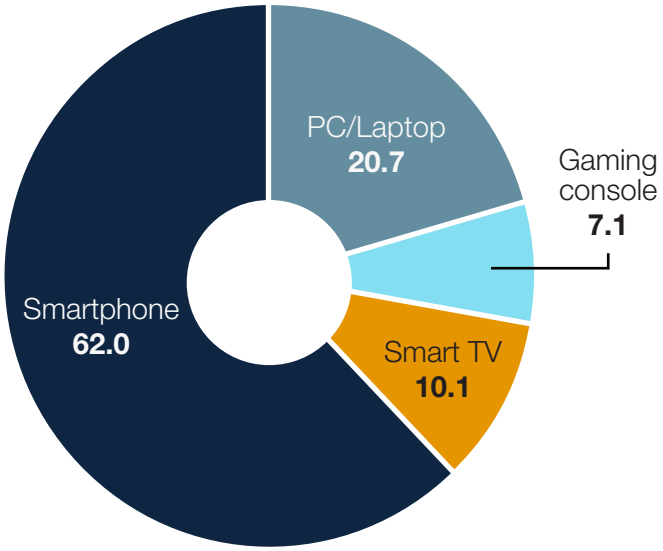

Figure 14: Device Used to Play Online Games (%)

Online Voice Calls

The survey also explored consumers' experiences with online voice calls. In 2024, 96.8% of FBB consumers reported having conducted online voice calls, with WhatsApp emerging as the most popular platform (96.0%). Other platforms used by consumers to make voice calls include WeChat and Facebook Messenger.

While service improvements have aimed to deliver seamless voice call experiences, 1.1% of users expressed dissatisfaction with the online voice call service. Among those dissatisfied, 55.2% cited choppy voice as the main reason, while 24.1% were disappointed by dropped calls occurring during their conversations.

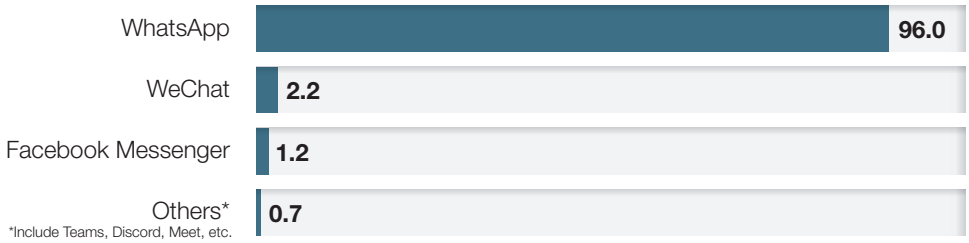

Figure 15: Online Voice Calls Experience of FBB Consumers (%)

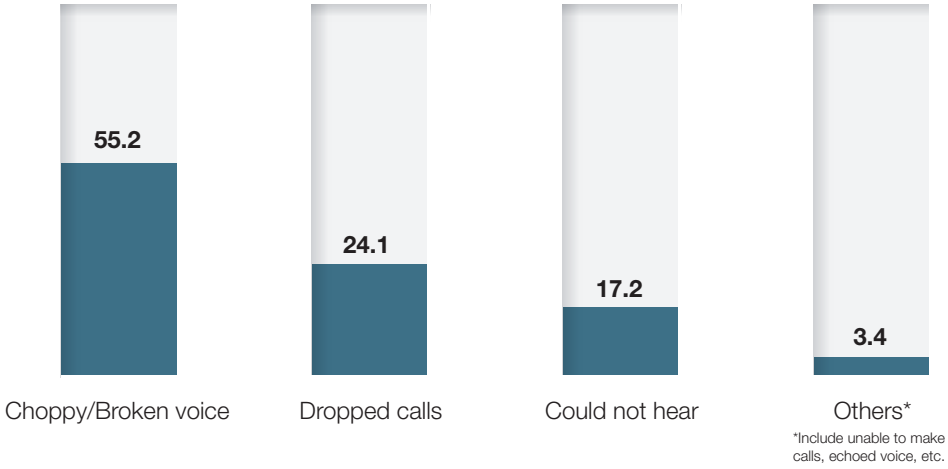

Figure 16: Main Reason for Online Voice Calls Dissatisfaction (%)

Online Video Calls

Figure 17 provides a detailed overview of the online video call experiences of FBB consumers. Among the 98.4% of FBB consumers who made online video calls, WhatsApp remained the most popular service, used by 78.8% of consumers. Interestingly, WhatsApp also maintained its position as the top app in terms of user satisfaction, far ahead of FaceTime (5.3%), Teams (4.7%) and Zoom (4.7%).

However, 1.2% of FBB consumers expressed their dissatisfaction with the online video call service, citing reasons such as video froze or disconnected, choppy or broken voices and low video quality, all at 28.1%.

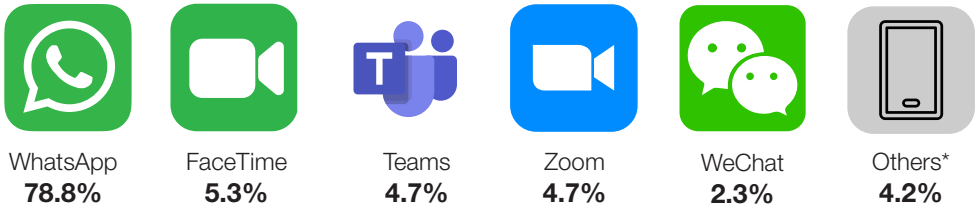

Figure 17: Online Video Calls Experience of FBB Consumers (%)

MBB CONSUMERS

CSI Score by Scope

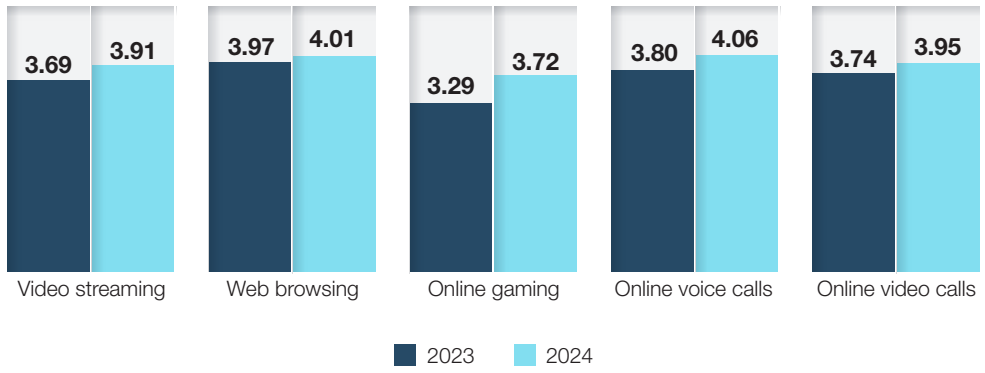

Figure 18: CSI Score by Scope for MBB

The survey found that two scopes of MBB namely web browsing and online voice calls managed to achieve high satisfaction rate from consumers to reach the Zone of Loyalty (>4.00). As illustrated in Figure 18, online voice calls topped the list with CSI score of 4.06 followed by web browsing (4.01) and online video calls (3.95) at second and third rank respectively. Similar with FBB, online gaming witnessed highest increase of 0.43 and manage to improve its position from Zone of Defection (<3.50) to Zone of Indifference (3.50-4.00).

Service Quality Gap Analysis

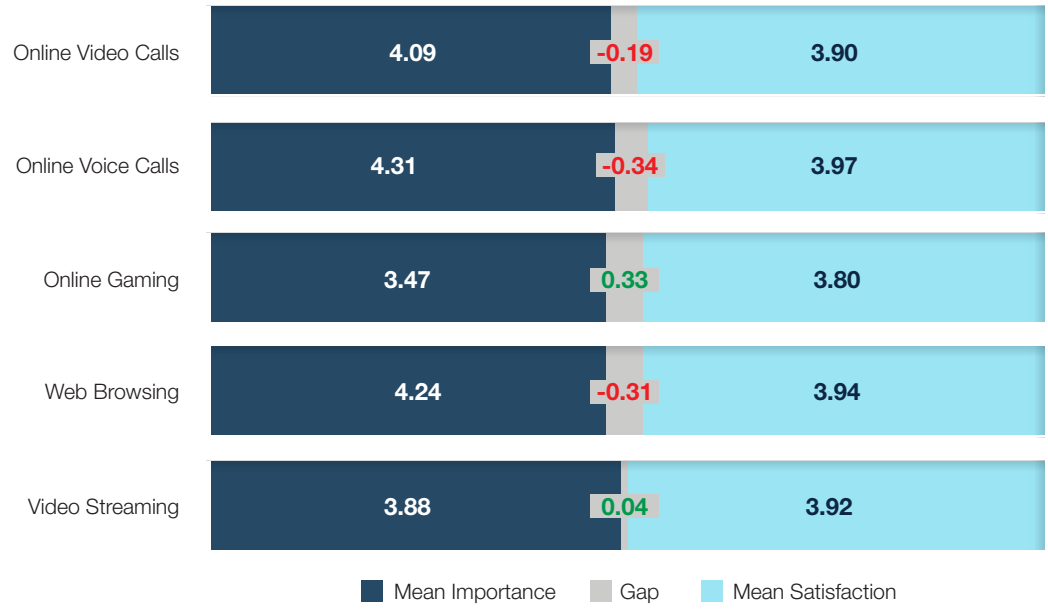

Figure 19: Service Quality Gap Analysis for MBB

Overall, the performance of MBB services shows a negative gap score of -0.09, demonstrate that consumers expectations towards the services provided were not met. Out of five scopes assessed, online gaming and video streaming exceeded consumers' expectations (Gap score: 0.33 and 0.04). The gap score for remaining three scopes is below 0, indicating consumers' expectations were not met. Highest gap score was observed in online voice calls (-0.34) followed by web browsing (-0.31) and online video calls (-0.19).

In terms of gap score improvement, web browsing had the highest improvement as compared to 2022, from -0.55 to -0.31 (+0.24) as a result of higher rating in service performance score. Figure 19 further illustrates the gap scores for MBB consumers.

Importance-Performance Analysis

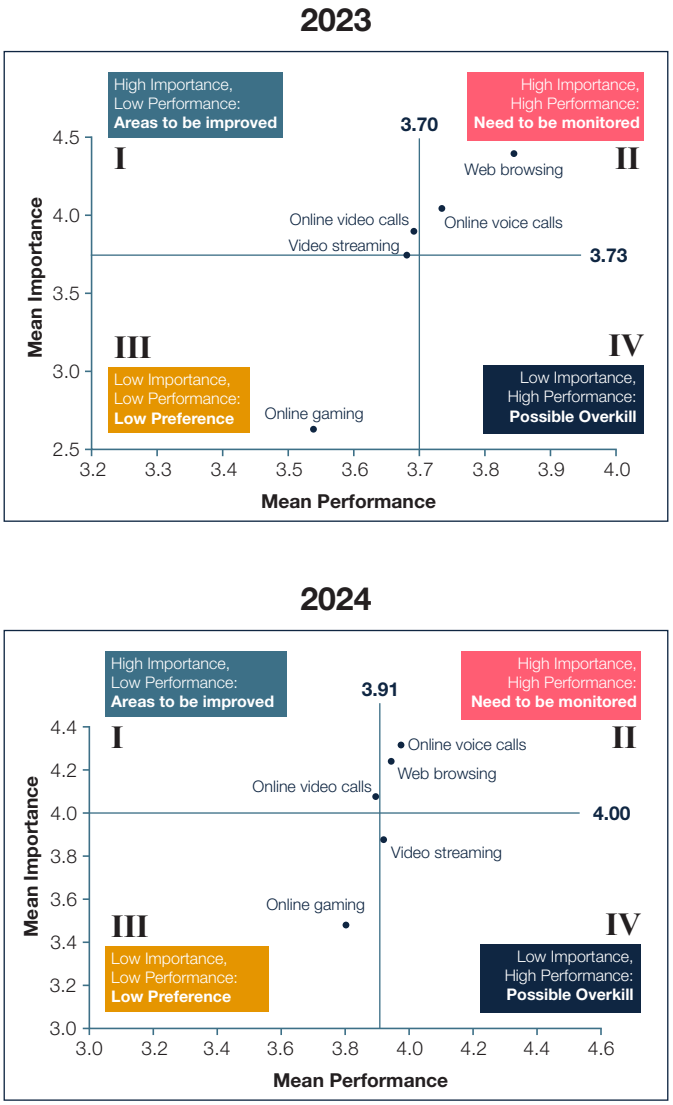

Figure 20: Importance-Performance Analysis for MBB

Furthermore, results from IPA analysis showed that mean importance and mean performance for MBB were 4.00 and 3.91 respectively, moderately increased from 2023 as depicted in Figure 20 above.

From the IPA analysis, web browsing and online voice calls maintain its performance above average in Quadrant II (High importance, High performance). Hence, all these scopes need to be monitored accordingly to sustain performance and customers satisfaction.

Meanwhile, shifting of video streaming a lower-importance quadrant in 2024 was likely due to changing user priorities favouring real-time communication, widespread offline viewing options and consistent high performance making it less of a differentiator. This reflects a mature and stable service rather than declining quality.

Consumers Consumption Pattern by Scope

Video streaming

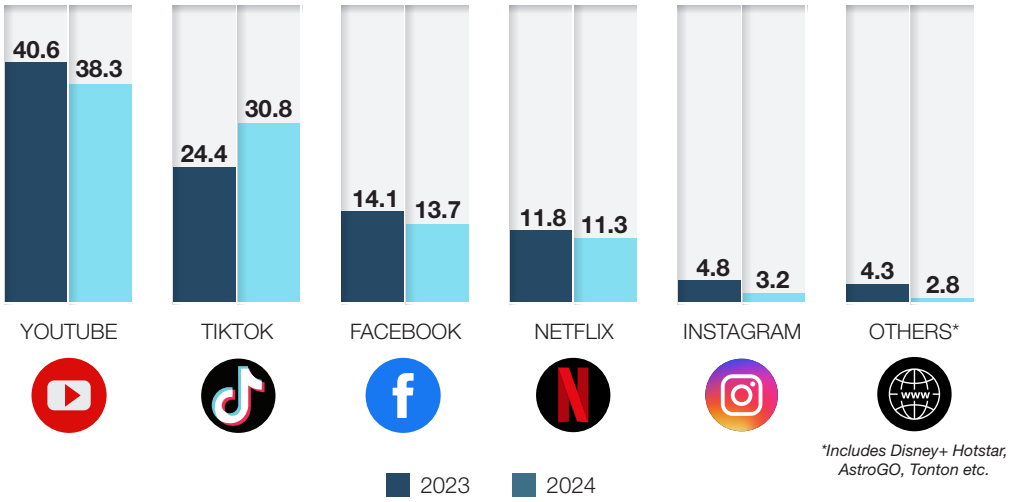

Figure 21: Video Streaming Experience by MBB Consumers (%)

The survey further discovered that 83.5% of MBB consumers watched videos online. YouTube remained as a lead platform with 38.3% of consumers identifying it as their primary source for video content. TikTok, however, has been gaining significant popularity emerging as the second most-used platform with 30.8% of consumers preferring it for video streaming. This was followed by Facebook with 13.7% and Netflix ranked fourth with 11.3% of consumers choosing it as their main platform for online video content.

In 2024, 4.5% of MBB consumers who streamed videos online were unhappy with their experience. Among these users, the primary concern was video stalls and buffering cited by 52.4% as the main reason for their dissatisfaction. This was followed by slow video loading times with 22.3% indicating that videos taking too long to load and begin playing.

Web Browsing

BQoES 2024 revealed that 55.8% of MBB consumers preferred to use application while 44.2% favoured web browser for their web browsing activities.

Among those who preferred to use web browser, 78.4% browse through Google Chrome followed by 17.4% through Safari. On the other hand, Shopee was the most popular application among MBB consumers (54.6%) followed by Grab and Spotify with 10.2% and 7.3% respectively.

Further analysis shows that percentage of dissatisfied consumers on web browsing experience has declined significantly from 14.8% in 2023 to just 0.9% in 2024. The most commonly cited issues were the frustration of waiting for pages to load and slow download speed, each reported by 24.0% of respondents.

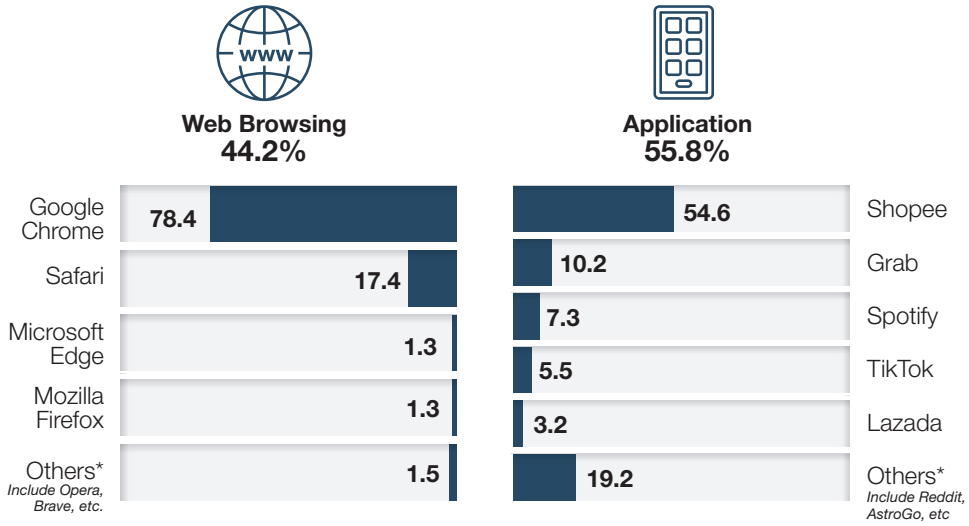

Figure 22: Web Browsing Experience by MBB Consumers (%)

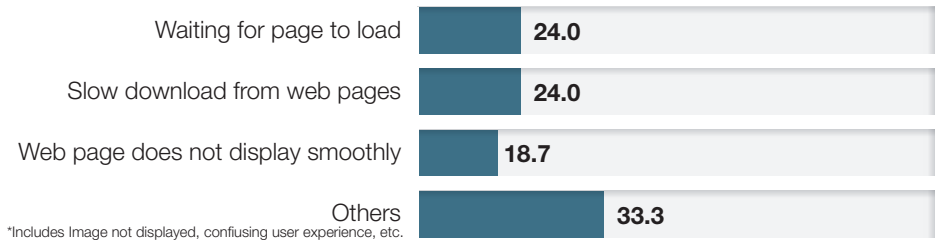

Figure 23: Main Reason for Web Browsing Dissatisfaction (%)

Online Gaming

BQoES 2024 observed that percentage of online gamers among MBB consumers has slightly increased from 44.8% in 2023 to 48.6% in 2024. The most popular online games among MBB consumers were Mobile Legend: Bang Bang (39.0%), PlayerUnknown's Battlegrounds Mobile (10.0%) and Candy Crush Saga (8.0%). Among the least played online games by MBB consumers were Clash of Clans, Roblox, eFootball 2024 and FIFA Ultimate Team.

However, dissatisfaction among MBB consumers who engage in online gaming was reported at 3.5%, with reasons such as animation stuttering (42.9%) and latency/lag (33.3%) being cited as primary concerns.

When asked about the devices they mainly used for playing online games, the data revealed that the smartphone is by far the most commonly used device with 89.7% of consumers indicating it as their primary means of accessing online services. Other devices were used to a much lesser extent such as PC/laptops/tablets accounted for 7.8% and gaming console were used by 2.0% of respondents.

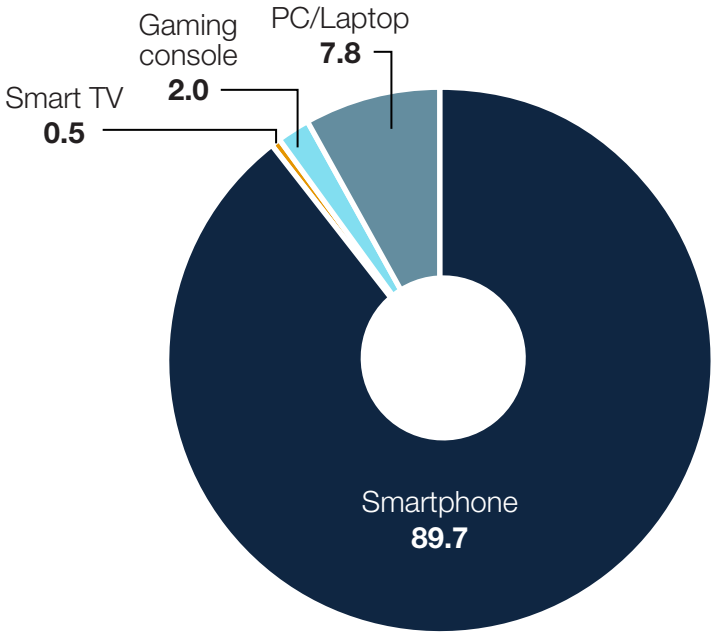

Figure 24: Device Used to Play Online Games (%)

Online Voice Calls

The survey also investigated consumers' experiences with online voice calls. In 2024, 89.3% of MBB consumers reported engaging in online voice calls, with WhatsApp emerging as the most popular platform (95.6%).

An analysis of user feedback on online voice calls services highlights key areas for service enhancement. Among 2.2% of dissatisfied users, majority (49.0%) cited choppy or broken voice quality as the primary concern. Another significant issue was dropped calls during conversations, affecting 24.0% of consumers. Additionally, 16.0% of users reported being unable to hear the other person.

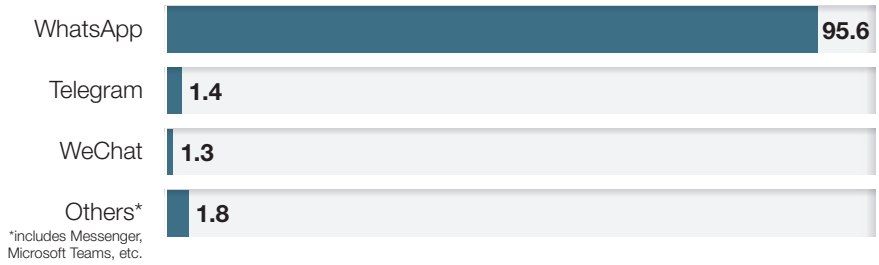

Figure 25: Online Voice Calls Experience of MBB Consumers (%)

Online Video Calls

Figure 26 shows experience of the online video calls among MBB consumers. The survey revealed that out of the 88.7% of MBB consumers who engaged in online video calls, WhatsApp remained the most popular apps (89.5%) followed by FaceTime (3.2%).

Among 2.6% users reported dissatisfaction with online video calls, the most prevalent issue was freezing or disconnected video, cited by 38.9% of users. This was followed by choppy or broken voice (23.0%), low picture quality (15.9%) and difficulties connecting to the call (8.0%). These findings highlight the need for continued enhancements in both video and audio stability to ensure a seamless communication experience.

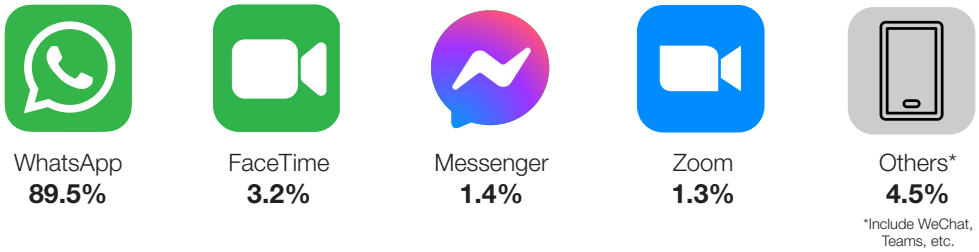

Figure 26: Online Video Calls Experience of MBB Consumers (%)

DEMOGRAPHIC PROFILE

DEMOGRAPHIC PROFILE FOR FBB AND MBB CONSUMERS

FBB Consumers

BQoES 2024 results reflect the demographic profile of adults, with 65.5% of FBB consumers falling within the age range of 30s and 40s. More than one third of FBB consumers (38.2%) reported earnings between RM4,850 and RM10,959 as their average monthly income. In terms of employment status, 85.8% were working individuals, including both employed and self-employed individuals. These findings suggest that subscribers to fibre broadband services are typically financially stable individuals.

There was a notable gender gap, with male consumers accounting for 72.9% and female consumers accounting for 27.1% of the total. Additionally, the survey revealed a significant disparity in the distribution of FBB consumers between urban and rural areas. The majority of consumers (85.0%) were located in urban areas, while only 15.0% resided in rural areas.

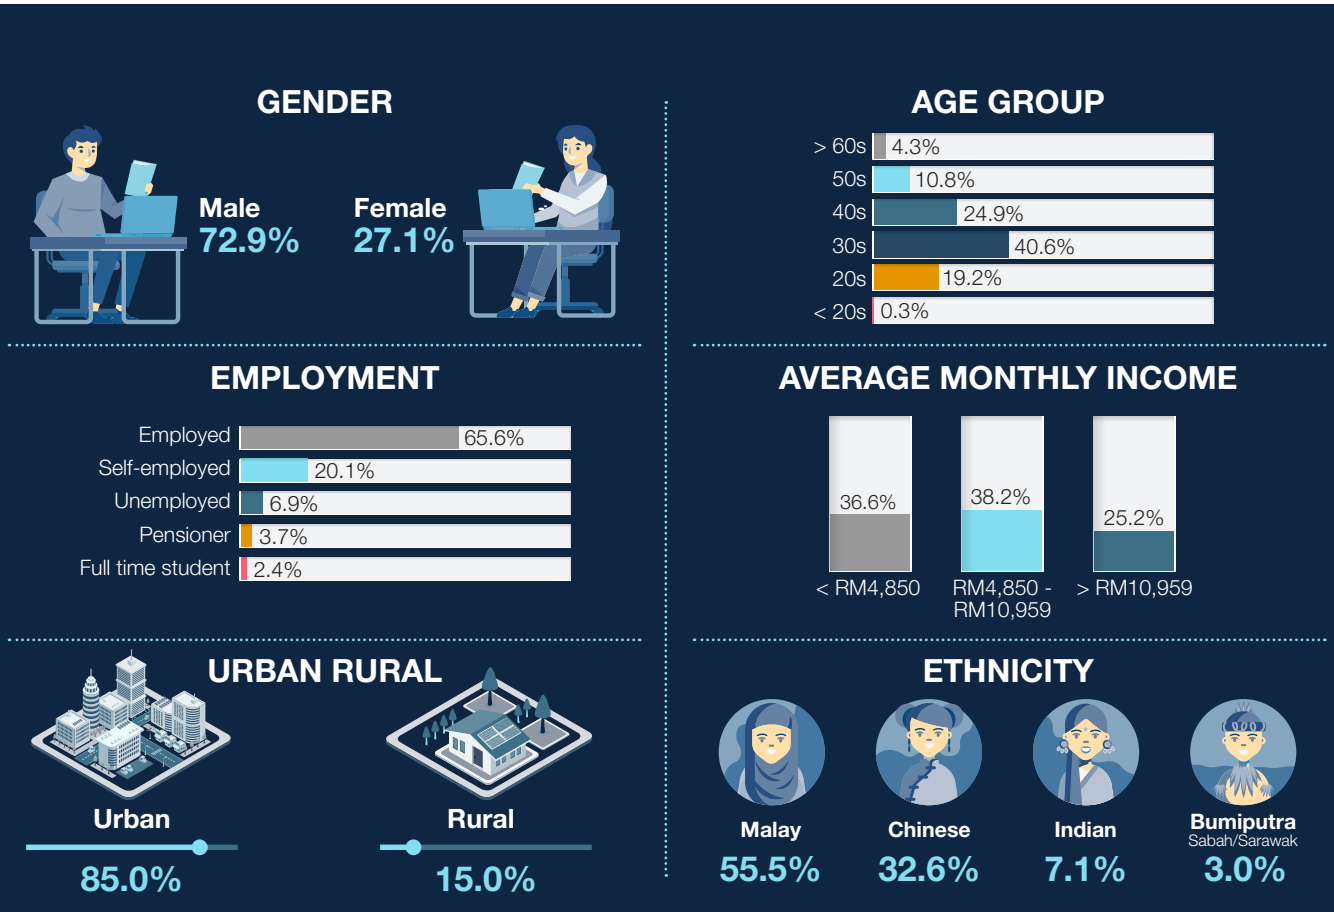

Figure 27: Demographic profile for FBB consumers

MBB Consumers

The survey revealed that MBB consumers were predominantly young adults, with those in their 20s and 30s accounting for 64.1% of the total. In terms of average monthly income, the highest distribution of MBB consumers was observed in the income bracket of below RM4,850 (52.7%). Regarding employment status, 74.9% of MBB consumers were working individuals, which is slightly lower than the percentage observed for FBB consumers. However, full-time students and unemployed individuals accounted for a slightly higher proportion of MBB consumers compared to FBB consumers (21.6% vs. 9.4%). These findings suggest that MBB is perceived as an affordable service, as it attracts more young people and dependents.

There was a notable gender gap, with male consumers accounting for 64.6% and female consumers accounting for 35.4% of the total. Additionally, the survey revealed a significant disparity in the distribution of MBB consumers between urban and rural areas. The majority of consumers (70.1%) used the service in urban areas, while 29.9% resided in rural areas.

Over the past three years, broadband services in Malaysia have shown steady and measurable improvement in consumer experience. This progress has been largely attributed to strategic collaboration between the MCMC and service providers which has been led to significant upgrades in infrastructure, network performance and service offerings. As a result, consumers have begun to enjoy more consistent connectivity, improved speeds and wider access to digital services contributing to a more digitally empowered population.

These enhancements have contributed to a notable gains in customer satisfaction as users increasingly benefit from effective communication, more reliable connections and better overall service delivery. Fixed and mobile broadband service providers as well as other stakeholders have responded to growing demand by investing in technology upgrades, expanding coverage areas and improving quality of customer care. Consumer sentiment has gradually shifted in a positive direction, indicating that the collaborative regulatory and industry efforts have led to clear improvements.

To sustain this momentum, continuous improvement on network reliability, speed and customer care quality is essential. These elements are critical not only for enhancing user experience but also for fostering customer loyalty and reducing churn. As digital usage continues to expand across various types of users, maintaining high standards in broadband service delivery is vital to secure a long-term consumer trust and supporting Malaysia's digital economy initiatives.
